The main reduction of external dimensions to internal is height. Commonly, the height of a container will be 8 feet at 6 ° C and a high cube will have an additional foot to have 9 feet to 6. The useful load (or net weight) is the weight of the load or content that may contain one container. Internal dimensions The sides of a container in almost all cases, corrugate. The weight downloaded from a 20-foot container is 2,300 kg and can, in theory, load up to a maximum weight of 28 tons (25,400 kg). The shipping containers and storage containers can come in a range of size, 20-foot shipping containers and 40 feet and 40 feet are the most common container lengths (externally) and 8 feet wide of Standard shape. The dimensions of the 20 feet container are generally measured using the imperial system (feet) and specifies both outer dimensions and the internal dimensions (usable). The dimensions of a 20-foot container are: outer dimensions (in feet): 20 x 8 à, x 8 A "e widths x 8 '6 ~ ~ ~ tall outer dimensions (in meters): 6.10m long x 2.44m wide x 2.59 m high interior dimensions (in feet): 19 à, ~ 4 long x 7 '9 à, ~ wide x 7 '10 ~ ~ ~ internal dimensions High (in meters): 5.898m long x 2.352m wide x 2.393m Hightable capacity Usable: 32.6m3 Calculate maritime transport in terms of European pallette types (European pallets) of which dimensions are 1.2mx 0.8m, the base of the 20-foot container can contain up to 11 Stacks of pallets in euros, as long as the load is not hanging on the sides. More information. Container weights There are three relevant weights, tare weight, gross weight and useful load. Although the height of the door is further reduced due to the upper rail rail above the door, this is a part of the structural integrity of the container, it is generally 4 inches (100 mm), which reduces the entry height to 7 feet (2.28 m).), although this may vary slightly in any way.
